METHODS AND APPARATUS FOR SELF SERVICE NETWORKS

Abstract

An ATM network comprises ATM's (22-1, 22-2, 22-3) coupled by an ATM switch (24) to a processor (26) and data warehouse (28). Information may be gathered about performance of the ATM network (20) and used to generate rules (34) for adjusting transaction charges incurred by use of the ATM. The rules may take into account usage patterns of the ATM and also collateral data such as weather forecasts and local event fixture lists.
